EC - material safety data sheet

By definition, EC - material safety data sheets according to DIN 52900 are only to be used for chemical materials and preparations (purpose, field of application according to DI standard).

Since paper is a commodity, it does not belong to this group of materials and is therefore subject to the laws governing foodstuffs and consumer goods.

For this reason, most of the points on the safety data sheets are not applicable to paper. The only points to be observed are those concerning inflammability (flash point approx. 250 °C) and hazardous decomposition products in case of partial combustion (e.g. carbon monoxide).

When used correctly and for the stated intended use, paper is completely harmless from a toxic point of view.

We hope that this information will be of assistance to you.

Yours truly,
Cham Paper Group Schweiz AG
